

Mailroom Safety

Because the risk is too great

Powdersafe Biological & Chemical Hazard Isolation System

- Powdersafe places you in control to manage the contaminated mail incident, the letter is no longer the driving force.
- Allows the organisations to meet legislated Occupational Health and Safety obligations
- Minimise the risk of contamination and trauma for employees opening suspect mail
- Minimise the risk of business lock-down and decontamination procedures for the organisation.

Powdersafe is a complete system that's been developed to protect mail centre staff when postal items containing suspicious powders are encountered. It is effective and of great value regardless of whether the powders are viable biological or chemical hazards or simple hoaxes. It provides for the safe opening of the postal item within a sealed unit; the safe removal of the item from the mail centre; the transport of the item to a testing facility; easy sampling of the powder for testing purposes; and the establishment of a chain of custody throughout the entire process.

Powdersafe was developed in Australia and is currently being used by many governmental and security agencies there after undergoing extensive testing and certification.

SuperOmniPlus Hand-held Metal Detector

The SuperOmniPlus is a rugged, hand-held metal detector designed to detect metallic weapons and objects using a non-contact, physical screening procedure.

It incorporates high quality construction with a sophisticated electronic design for reliability. The Piezo Audio System offers extended battery life due to low power consumption.
